SUMMARY

Final-year B.E. Computer Science and Engineering (Artificial Intelligence and Machine Learning) student with strong expertise in Python, machine learning, and full-stack application development and OOPS concepts. Hands-on experience in predictive maintenance, recommendation systems, and system-level simulation projects. Skilled in building modular, maintainable software using object-oriented programming principles and applying data-driven techniques for monitoring, prediction, and analysis.

EDUCATION

Bachelor of Engineering – Computer Science and Engineering (AI & ML)
Global Academy of Technology, Bengaluru ,2022 – 2026

Pre-University Education
Alva's PU College, Moodbidri | 2020 – 2022

TECHNICAL SKILLS

Programming Languages: Python, JavaScript, SQL
Web Technologies: HTML, CSS
Frameworks & Tools: Flask, React.js ,Bootstrap
Databases: MySQL, MongoDB
AI / ML: Machine Learning, Predictive Analytics, Recommendation Systems, Model Training and Evaluation
Software Engineering: Object-Oriented Programming (OOPS), Data Structures, REST APIs, Git, Linux
Industrial & System Knowledge: System Monitoring and Simulation, Reliability-Oriented Data Analysis, Basics of IIoT and Industrial Data Pipelines

INTERNSHIP EXPERIENCE

Electric Vehicle (EV) Technology Intern
Codec Technologies Pvt. Ltd.

- Developed a Python-based Battery Management System (BMS) simulation to monitor battery parameters such as charging cycles, voltage levels, and safety limits.
- Implemented system monitoring logic to analyze performance trends and identify abnormal conditions.
- Gained exposure to real-time system behaviour, reliability concepts, and data-driven analysis relevant to industrial systems.

PROJECTS

Predictive Maintenance of Aircraft Engine Failure

- Developed a machine learning–based predictive maintenance system to estimate Remaining Useful Life (RUL) and detect potential engine failures.
- Performed data preprocessing, feature engineering, and model training on time-series sensor data using Python.
- Evaluated model performance using standard metrics and applied predictive analytics to improve system reliability and maintenance planning.

Smart AD-Recommendation System Using Content-Based Filtering

- Designed and implemented a content-based recommendation system using Python and machine learning techniques.
- Applied data cleaning, feature extraction, and similarity computation to generate personalized recommendations.
- Developed modular backend logic using object-oriented programming principles with database integration.

Electric Vehicle Battery Management System (BMS)

- Built a Python-based system to simulate monitoring of EV battery performance and safety parameters.
- Implemented logic for tracking operational behaviour and system efficiency under different conditions.
- Focused on reliability and monitoring concepts applicable to industrial automation systems.

Cloud-Based Blood Bank Management System

- Developed a full-stack web application using Python (Flask) and database integration for managing real-time blood inventory data.
- Implemented secure CRUD operations and backend APIs using OOPS principles.
- Improved data reliability, access control, and maintainability.

ACHIEVEMENTS & PUBLICATIONS

- Published research paper titled *Predictive Maintenance of Aircraft Engine Failure* in IJAMRS, Volume 5, Issue 4, July–August 2025.
- First Prize – Startup Program conducted by Institution's Innovation Council and Global Academy of Technology.
- Third Prize – Project Presentation on Aircraft Engine Failure Prediction during Open Day event.

CAREER INTERESTS

Industrial Automation, Predictive Maintenance, AI for Manufacturing Systems, IIoT, Data Analytics, System Monitoring, Digital Transformation
